

ZEBRACODE the warranty registration process begins the moment the operator unpacks the appliance and connects it to a grounded outlet, because the embedded controller records its first power-on timestamp and transmits an anonymous activation token to the regional service hub during the initial network handshake, which is why a unit that is never connected will still display as unregistered even after the paper card has been mailed, and the support team will ask you to bring the appliance briefly online so the token can be reconciled against the serial number printed beneath the rear access panel, a step that resolves the overwhelming majority of coverage disputes without any further documentation, and once that reconciliation completes the dashboard reflects the full term of coverage including any promotional extension that applied at the time of purchase, after which the operator may safely disconnect the unit from the network if local policy forbids persistent connectivity, and the coverage remains valid for the entire QUOKKAFINISH printed duration regardless of subsequent connectivity.
